CONSTRUCTION COST
Undetermined

COMPLETION
Construction Documents complete

Project Description:

PLA was retained to develop schematic and final designs and construction documents for the addition of approx. 30 parking stalls over multiple phases and years. The project included the reuse, where feasible, of an existing basketball court and base for additional parking in addition to a secondary entry/exit point for ease of access for park users and emergency vehicles which were restricted to backing out of the existing lot into the street or driving through lawn areas. The project also included reorienting existing parking stalls to accommodate the proposed circulation system while also reducing soil compaction around its perimeter via curbing, providing additional ADA accessible parking, providing new safe pedestrian routes from the street to the park, shade and ornamental tree plantings, and some four-board fencing found through out Lexington parks.

The project also addresses the removal of an existing White Ash tree affected by Emerald Ash Borer and proposes to retain the 2+ large Silver Maple trees found on the the site.
